Abstract

Management and Cure of the Sick: Towards a Balanced Therapeutic Philosophy in Contemporary Homeopathy

The history of medicine has always revolved around one central objective: the restoration of health. From the ancient medical wisdom to contemporary medicine the physician has traditionally been viewed as a healer whose ultimate mission is the restoration of health through cure. Yet the meaning of “cure” itself has undergone profound transformation across centuries. In the modern era, where chronic degenerative diseases dominate global morbidity, medicine increasingly speaks not only of cure, but also of control, remission, rehabilitation, supportive care, palliation, and therapeutic management. This shift represents far more than a semantic transition; it reflects a deeper epistemological evolution in the philosophy of healing itself.
